## Walnut

2.13 Walnut

### Reference:”

Hebrew עֵגוֹז ('egoz) SNG 6:11

### Discussion:

Walnut tree (Georg Slickers (Wikimedia Commons))The identity of 'egoz ("nut orchard") mentioned in [SNG 6:11](#) is debated. It may well have been the walnut (CEV, GW, FRCL, GECL), since this tree was well known in biblical times, even though it is not mentioned in the Bible except for this possible reference. The majority of versions play it safe with "nut orchard" (RSV) "grove of nut trees" (NIV), or something similar. GNB has "almond," which is also possible, although one could ask why the writer would not have used one of the two normal Hebrew words for almond (*luz* or *shaqed*) if that is what he meant.

The Jewish historian Josephus noted that walnuts were cultivated in the area of Lake Galilee, and other early Jewish writings describe various walnut products, including the oil, tannin (used for leather processing), and wood. In East Jerusalem there is a place called the Valley of Walnuts. Further support for the identification of 'egoz as walnut comes from the Arabic cognates *goz* and *jauz* referring to the walnut.

**Description:**

*Description:*

*Description:*

Walnut bark (Dalgial (Wikimedia Commons))The Middle Eastern Walnut Tree *Juglans regia* grows to around 6–8 meters (20–26 feet) and has a stout trunk with many branches and a rounded crown. The wood, being very hard, is excellent for furniture. The tree is native to southeastern Europe, and there were once also forests of walnuts in the Caucasus, northern Turkey, Iran, and other West Asian countries. It was probably introduced into Canaan from Turkey or what is now Iran.

There are forty subspecies of walnuts spread throughout the temperate regions of Europe, Asia, and the Americas, all the way down to the Andes Mountains. A type of walnut is also found in Japan. There are also trees in tropical areas called “walnut” because of some similarity to the true walnut. For example, the so-called African walnut (or Nigerian golden walnut) is the *Lovoa trichilioides*; the East Indian walnut is the *Albizia lebbek*; the New Guinea walnut is a species of *Dracontomelon*; the Otaheite walnut is the *Aleurites moluccana*; the Australian walnut is the *Endiandra palmerstonii*. The best-known member of the genus is the Persian Walnut or Common Walnut *Juglans regia*, native from the Balkans in southeastern Europe, southwestern and central Asia, and southwestern China. The Persian walnut is often but incorrectly known as English walnut in the United States (the species is not native to England). The world’s largest and oldest wild walnut forests are in Jalal-Abad province of Kyrgyzstan, at Arslanbob.

### Special significance:

Walnut (Fir0002 at English Wikipedia (Wikimedia Commons))SNG 6:11 (“I went down to the nut orchard ...”) portrays a setting of beauty and fragrance that gives way to a day dream: “My fancy set me in a chariot beside my prince.” The common walnut was, and is, widely cultivated for its delicious nuts, but also produced oil and had fragrant leaves and abundant shade. Walnut trees feature positively in Greek and European mythology, but during the Dark Ages of Europe, people came to fear them since the dense leaves were thought to be hiding places for demons. The Arabs used walnut wood for shields and made ink from the shells of the nuts. The nuts and oil were also considered medicinal.

### Translation:

The English word “nut” is a generic term used to refer to a strange variety of seeds, fruits, and roots (peanuts). There is unlikely to be such a generic word in many languages. So either a more general phrase like “garden of fruit trees” or a more specific name is more likely to be required. If a specific transliteration is desired, “walnut” perhaps has more in favor of it than “almond.” Translators living in areas where the true walnut grows are encouraged to use it. Translators living in areas where there are so-called “African walnuts” like the species (*Lovoa trichilioides*) in Nigeria, can use such equivalents as well, even though they are not botanically exact.

Since [SNG 6:11](#) is a poetical passage, the translator may choose to “domesticate” the text by using an appropriate local equivalent or to “foreignize” the text by using a transliteration from a major language. Domestication will probably sound more poetic, and a footnote can give the botanical facts as far as we know them. On the other hand, a generic phrase like “garden of fruit trees” is not necessarily unpoetic.

I would favor something in this order of preference:

1. generic “garden of fruit trees”;
2. local equivalent of a particularly tasty fruit;
3. transliteration from “walnut” in a major language. Some models are Arabic *djawz*, Spanish *nogal comun*, French *noix royal / noix comun*, Portuguese *noguera comun*, and Chinese *hu tao*.
